

ADTA 5900/5560: Assignments

Important Notes

Thuan L Nguyen, PhD

1. Overview

The **stocks** of a publicly listed company can be **split** (to increase the outstanding number of stocks issued to the public) or **reverse-split** (to reduce the number of the outstanding number of stocks issued to the public.)

As a result, the **prices**, e.g., opening price or closing price **at a particular business day** of the stocks of a publicly listed company **can be changed**, either **reduced** (if the stock is split) or **increased** (if a reverse stock split occurs) along the history of the stock.

2. Apple Stock (APPL)

The **stock of APPLE (AAPL)** has been **split many times**. Therefore, it is **likely** that the **stock prices** that the student collects while working on HW 4 is **different** from those shown in the lecture videos.

3. Solution

It is **OK** to use the **current stock prices** in HW 4, no matter whether they are the same or different from those shown in the lecture videos.

There is **no significant impact** on the results of the training process of the neural network if the **stock prices are different** due to the **results of splits of the stocks** of APPLE.
